

**PATENT APPLICATION****IN THE UNITED STATES PATENT AND TRADEMARK OFFICE**

Appl. No. : 10/766,939
Applicant : Fumito Nariyuki
Filed : January 30, 2004
TC/A.U. : 1752
Examiner : Thorl Chea
Docket No : FS-F03228-01
Customer No. : 37398
Conf. No. : 4131

For: **PHOTOTHERMOGRAPHIC MATERIAL AND IMAGE FORMING METHOD**

DECLARATION UNDER 37 C.F.R. § 1.132

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

I, Fumito NARIYUKI, hereby declare and state:

THAT I am a citizen of Japan;

THAT I graduated from Tokyo University with a masters degree in Chemistry in March 2001;

THAT I joined Fuji Photo Film Co., Ltd. (now FUJIFILM Corporation, hereinafter, "Fuji") in April 2001, and thereafter, I am engaged in the research and development of photothermographic material and apparatus for medical use.

THAT I am the inventor of the subject matter disclosed and claimed in the above-identified application; and

THAT I am familiar with the Office Action of May 16, 2006 and the rejections set forth therein.

DECLARATION UNDER 37 C.F.R. § 1.132
U.S. Application No. 10/766,939

Attorney Docket No. FS-F03228-01

The following additional experiment was carried out by me or under my supervision.

EXPERIMENT

The present experiment demonstrates that a combination of high silver iodide content and an adsorbable redox compound represented by Formula (I), $A-(W)_n-B$, wherein B represents a residue derived from a compound represented by any one of Formulas B_1 to B_5 and Formula B_{13} provides unexpectedly superior results in terms of unprocessed storability. This is additional experimental data to the 37 C.F.R. § 1.132 declaration submitted on March 20, 2006.

The present experiment is conducted in the same manner as in the declaration submitted on March 20, 2006. As adsorbable redox compounds, compound (2), (11), (32) and (34) disclosed in the originally-filed specification on pages 117-120 are additionally used in the same mole amount. Thermal development and evaluation of unprocessed storability are carried out under the same conditions as in Example 1 disclosed in the originally-filed specification. Specifically, the type of radiation used in the imagewise exposure and the temperature in the heating steps are disclosed on page 196 of the specification. Tests are additionally conducted for development time of 5 seconds and 10 seconds.

The photosensitive material contains a polyhalomethane compound represented by Formula (H) as recited in presently-amended claim 1. Sensitivity is calculated at a density of fog density + 3.0, which is on the shoulder of photographic characteristic curve.

The adsorbable redox compounds used in the present experiment are shown below.

DECLARATION UNDER 37 C.F.R. § 1.132
U.S. Application No. 10/766,939

Attorney Docket No. FS-F03228-01

Formulas (2), (6), (11), (17), (20), (28), (32), (34) and (73) of the present

invention:

DECLARATION UNDER 37 C.F.R. § 1.132
U.S. Application No. 10/766,939

Attorney Docket No. FS-F03228-01

Formulas of 2, 6, 17 and 20 Okada:

2

6

17

20

Unprocessed storability is evaluated by measuring photographic sensitivity after storage under certain condition. The value of unprocessed storability in Table 1 is expressed in percentage, setting the sensitivity of each sample in a fresh state (i.e. without storage) as 100. The higher value means the better result. Obtained results are shown in Table 1 below.

From the obtained results can be read the following facts.

(i) With the samples containing silver halide emulsion A' which has a silver iodide content as low as 2 mol%, unprocessed storability deteriorates as development time becomes shorter independent from which adsorbable redox compound is used (either those of the present invention or those disclosed in Okada et al. (USP 6,120,983, hereinafter "Okada")).

DECLARATION UNDER 37 C.F.R. § 1.132
U.S. Application No. 10/766,939

Attorney Docket No. FS-F03228-01

(ii) Even if the silver iodide content is as high as 40-100 mol%, unprocessed storability deteriorates as development time shortens with Okada's adsorbable redox compounds 2, 17 and 20.

(iii) Unexpectedly superior results of 10% improvement of unprocessed storability are obtained with development time of 10 and 12 seconds compared to 15 seconds with the samples of the present invention using the combination of adsorbable redox compounds (2), (6), (11), (17), (20), (28), (32), (34) or (73) and silver iodide content of 40-100 mol%.

(iv) Generally speaking, unprocessed storability largely decreases with a short development time such as 5 seconds. However, 15% to 20% improvement of unprocessed storability are obtained with development time of 5 seconds by using the samples of the present invention using the combination of adsorbable redox compounds (2), (6), (11), (17), (20), (28), (32), (34) or (73) and silver iodide content of 40-100 mol%. These results are unexpectedly superior to the results of the above (i) (i.e. low silver iodide content) and (ii) (i.e. Okada's adsorbable redox compounds).
